

Package ‘chirps’

October 12, 2022

Type Package

Title API Client for CHIRPS and CHIRTS

Version 0.1.4

URL <https://docs.ropensci.org/chirps/>

BugReports <https://github.com/ropensci/chirps/issues>

Description API Client for the Climate Hazards Center 'CHIRPS' and 'CHIRTS'.

The 'CHIRPS' data is a quasi-global (50°S – 50°N) high-resolution (0.05 arc-degrees) rainfall data set, which incorporates satellite imagery and in-situ station data to create gridded rainfall time series for trend analysis and seasonal drought monitoring. 'CHIRTS' is a quasi-global (60°S – 70°N), high-resolution data set of daily maximum and minimum temperatures. For more details on 'CHIRPS' and 'CHIRTS' data please visit its official home page <<https://www.chc.ucsb.edu/data>>.

as.geojson	<i>Methods to coerce geographical coordinates into a geojson polygon</i>
------------	--

Description

Take single points from geographical coordinates and coerce into a geojson of geometry 'Polygon'

Usage

```
as.geojson(lonlat, dist = 1e-05, nQuadSegs = 2L, ...)
```

```
## Default S3 method:
```

```
as.geojson(lonlat, dist = 1e-05, nQuadSegs = 2L, ...)
```

```
## S3 method for class 'sf'
```

```
as.geojson(lonlat, dist = 1e-05, nQuadSegs = 2L, ...)
```

Arguments

lonlat	a data.frame or matrix with geographical coordinates lonlat, in that order, or an object of class 'sf' with geometry type 'POINT' or 'POLYGON'
dist	numeric, buffer distance for all lonlat
nQuadSegs	integer, number of segments per quadrant
...	further arguments passed to <code>sf</code> methods

Value

An object of class 'geojson' for each row in lonlat

Examples

```
# Default S3 Method
# random geographic points within bbox(10, 12, 45, 47)
library("sf")

set.seed(123)
lonlat <- data.frame(lon = runif(1, 10, 12),
                    lat = runif(1, 45, 47))

gjson <- as.geojson(lonlat)

#####

# S3 Method for objects of class 'sf'
# random geographic points within bbox(10, 12, 45, 47)
library("sf")

set.seed(123)
lonlat <- data.frame(lon = runif(5, 10, 12),
                    lat = runif(5, 45, 47))

lonlat <- st_as_sf(lonlat, coords = c("lon", "lat"))

gjson <- as.geojson(lonlat)
```

chirps

API Client for CHIRPS and CHIRTS

Description

API Client for the Climate Hazards Center 'CHIRPS' and 'CHIRTS'. The 'CHIRPS' data is a quasi-global (50°S – 50°N) high-resolution (0.05 arc-degrees) rainfall data set, which incorporates satellite imagery and in-situ station data to create gridded rainfall time series for trend analysis and seasonal drought monitoring. 'CHIRTS' is a quasi-global (60°S – 70°N), high-resolution data set of daily maximum and minimum temperatures. For more details on 'CHIRPS' and 'CHIRTS' data please visit its official home page <<https://www.chc.ucsb.edu/data>>.

Note

While **chirps** does not redistribute the data or provide it in any way, we encourage users to cite Funk et al. (2015) when using CHIRPS and Funk et al. (2019) when using CHIRTS.

 get_chirps

Get CHIRPS precipitation data

Description

Get daily precipitation data from the "Climate Hazards Group". Two server sources are available. The first, "CHC" (default) is recommended for multiple data-points, while "ClimateSERV" is recommended when few data-points are required (~ 50).

Usage

```
get_chirps(object, dates, server, ...)

## Default S3 method:
get_chirps(object, dates, server, as.matrix = FALSE, ...)

## S3 method for class 'SpatVector'
get_chirps(object, dates, server = "CHC", as.raster = TRUE, ...)

## S3 method for class 'SpatRaster'
get_chirps(
  object,
  dates,
  server = "CHC",
  as.matrix = TRUE,
  as.raster = FALSE,
  ...
)

## S3 method for class 'sf'
get_chirps(object, dates, server, as.sf = FALSE, ...)

## S3 method for class 'geojson'
get_chirps(object, dates, server, as.geojson = FALSE, ...)
```

Arguments

object	input, an object of class <code>data.frame</code> (or any other object that can be coerced to <code>data.frame</code>), <code>SpatVector</code> , <code>SpatRaster</code> , <code>sf</code> or <code>geojson</code>
dates	a character of start and end dates in that order in the format "YYYY-MM-DD"
server	a character that represent the server source "CHC" or "ClimateSERV"
...	additional arguments passed to <code>terra</code> or <code>sf</code> methods See details
as.matrix	logical, returns an object of class <code>matrix</code>
as.raster	logical, returns an object of class <code>SpatRaster</code>
as.sf	logical, returns an object of class <code>sf</code>
as.geojson	logical, returns an object of class <code>geojson</code>

Details

Data description at <https://data.chc.ucsb.edu/products/CHIRPS-2.0/README-CHIRPS.txt>

Additional arguments when using server = "CHC"

resolution: numeric, resolution of CHIRPS tiles either 0.05 (default) or 0.25 degrees

Additional arguments when using server = "ClimateSERV"

dist: numeric, buffer distance for each object coordinate

nQuadSegs: integer, number of segments per buffer quadrant

operation: supported operations for ClimateSERV are:

operation	value
max	= 0
min	= 1
median	= 2
sum	= 4
average	= 5 (<i>default value</i>)

Value

A matrix, raster or a data frame of CHIRPS data:

id the index for the rows in object

dates the dates from which CHIRPS was requested

lon the longitude as provided in object

lat the latitude as provided in object

chirps the CHIRPS value in mm

Note

get_chirps may return some warning messages given by `sf`, please look `sf` documentation for possible issues.

References

Funk C. et al. (2015). Scientific Data, 2, 150066.
doi: [10.1038/sdata.2015.66](https://doi.org/10.1038/sdata.2015.66)

Examples

```
library("chirps")
library("terra")

# Case 1: return as a data.frame
dates <- c("2017-12-15", "2017-12-31")
lonlat <- data.frame(lon = c(-55.0281, -54.9857), lat = c(-2.8094, -2.8756))

r1 <- get_chirps(lonlat, dates, server = "CHC")

# Case 2: return a matrix
r2 <- get_chirps(lonlat, dates, server = "CHC", as.matrix = TRUE)

# Case 3: input SpatVector and return raster
f <- system.file("ex/lux.shp", package = "terra")
v <- vect(f)
r3 <- get_chirps(v, dates, server = "CHC", as.raster = TRUE)

# Case 4: using the server "ClimateSERV"
r4 <- get_chirps(lonlat, dates, server = "ClimateSERV")

# Case 5: from "ClimateSERV" and return as a matrix
r5 <- get_chirps(lonlat, dates, server = "ClimateSERV", as.matrix = TRUE)
```

get_chirts

Get CHIRTS temperature data data

Description

Get daily maximum and minimum temperature data from the "Climate Hazards Group". CHIRTS-daily is a global 2-m temperature product that combines the monthly CHIRTSmax data set with the ERA5 reanalysis to produce routinely updated data to support the monitoring of temperature extreme. Data is currently available from 1983 to 2016. Soon available to near-present.

Usage

```
get_chirts(object, dates, var, ...)
```

Default S3 method:

```
get_chirts(object, dates, var, as.matrix = FALSE, ...)
```

```
## S3 method for class 'SpatVector'  
get_chirts(object, dates, var, as.raster = TRUE, ...)  
  
## S3 method for class 'SpatRaster'  
get_chirts(object, dates, var, as.raster = TRUE, ...)
```

Arguments

object	an object of class <code>data.frame</code> (or any other object that can be coerced to a <code>data.frame</code>), <code>SpatVector</code> , or <code>SpatRaster</code>
dates	a character of start and end dates in that order in the format "YYYY-MM-DD"
var	character, A valid variable from the options: "Tmax", "Tmin", "RHum" and "HeatIndex"
...	additional arguments passed to <code>terra</code>
as.matrix	logical, returns an object of class <code>matrix</code>
as.raster	logical, returns an object of class <code>SpatRaster</code>

Details

Variable description from <https://data.chc.ucsb.edu/products/CHIRTSdaily/aaa.Readme.txt>

Tmax Daily average maximum air temperature at 2 m above ground

Tmin Daily average minimum air temperature at 2 m above ground

RHum Daily average relative humidity

HeatIndex Daily average heat index

Value

A `SpatRaster` object if `as.raster=TRUE`, else `matrix`, `list`, or `data.frame`

Additional arguments

interval: supported intervals are "daily", "pentad", "dekad", "monthly", "2-monthly", "3-monthly", and "annual". Currently hard coded to "daily".

Examples

```
library("chirps")  
library("terra")  
  
# Case 1: input a data frame return a data frame in the long format  
dates <- c("2010-12-15", "2010-12-31")  
lonlat <- data.frame(lon = c(-55.0281, -54.9857),  
                    lat = c(-2.8094, -2.8756))  
  
temp1 <- get_chirts(lonlat, dates, var = "Tmax")
```

```

# Case 2: input a data frame return a matrix
temp2 <- get_chirts(lonlat, dates, "Tmax", as.matrix = TRUE)

# Case 3: input a raster and return raster
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
temp3 <- get_chirts(v, dates, var = "Tmax", as.raster = TRUE)

# Case 4: input a raster and return raster
temp4 <- get_chirts(v, dates, var = "Tmax", as.matrix = TRUE)

```

get_esi

Get evaporative stress index (ESI) data

Description

Get evaporative stress index (ESI) from SERVIR Global via ClimateSERV API Client. ESI is available every four (or twelve) weeks from 2001 to present. The dataset may contain cloudy data which is returned as NAs. ClimateSERV works with geojson of type 'Polygon'. The input object is then transformed into polygons with a small buffer area around the point.

Usage

```
get_esi(object, dates, operation = 5, period = 1, ...)
```

```
## Default S3 method:
```

```
get_esi(object, dates, operation = 5, period = 1, ...)
```

```
## S3 method for class 'sf'
```

```
get_esi(object, dates, operation = 5, period = 1, as.sf = FALSE, ...)
```

```
## S3 method for class 'geojson'
```

```
get_esi(object, dates, operation = 5, period = 1, as.geojson = FALSE, ...)
```

Arguments

object	input, an object of class <code>data.frame</code> (or any other object that can be coerced to <code>data.frame</code>), <code>SpatVector</code> , <code>SpatRaster</code> , <code>sf</code> or <code>geojson</code>
dates	a character of start and end dates in that order in the format "YYYY-MM-DD"
operation	optional, an integer that represents which type of statistical operation to perform on the dataset
period	an integer value for the period of ESI data, four weeks <code>period = 1</code> , twelve weeks <code>= 2</code>
...	additional arguments passed to <code>terra</code> or <code>sf</code> methods See details
as.sf	logical, returns an object of class <code>sf</code>
as.geojson	logical, returns an object of class <code>geojson</code>

Details

operation: supported operations are:

operation	value
max	= 0
min	= 1
median	= 2
sum	= 4
average	= 5 (<i>default value</i>)

dist: numeric, buffer distance for each object coordinate

nQuadSegs: integer, number of segments per buffer quadrant

Value

A data frame of ESI data:

id	the index for the rows in object
dates	the dates from which ESI was requested
lon	the longitude as provided in object
lat	the latitude as provided in object
esi	the ESI value

Note

get_esi may return some warning messages given by [sf](#), please look sf documentation for possible issues.

Examples

```
lonlat <- data.frame(lon = c(-55.0281, -54.9857),
                    lat = c(-2.8094, -2.8756))

dates <- c("2017-12-15", "2018-06-20")

# by default the function set a very small buffer around the points
# which can return NAs due to cloudiness in ESI data

dt <- get_esi(lonlat, dates = dates)

# the argument dist passed through sf increase the buffer area

dt <- get_esi(lonlat, dates = dates, dist = 0.1)
```

 get_imerg

Get Integrated Multisatellite Retrievals for GPM (IMERG) data

Description

The IMERG dataset provides near-real time global observations of rainfall at 10km resolution, which can be used to estimate total rainfall accumulation from storm systems and quantify the intensity of rainfall and flood impacts from tropical cyclones and other storm systems. IMERG is a daily precipitation dataset available from 2015 to present within the latitudes 70 and -70.

Usage

```
get_imerg(object, dates, operation = 5, ...)

## Default S3 method:
get_imerg(object, dates, operation = 5, ...)

## S3 method for class 'sf'
get_imerg(object, dates, operation = 5, as.sf = FALSE, ...)

## S3 method for class 'geojson'
get_imerg(object, dates, operation = 5, as.geojson = FALSE, ...)
```

Arguments

object	input, an object of class <code>data.frame</code> (or any other object that can be coerced to <code>data.frame</code>), <code>SpatVector</code> , <code>SpatRaster</code> , <code>sf</code> or <code>geojson</code>
dates	a character of start and end dates in that order in the format "YYYY-MM-DD"
operation	optional, an integer that represents which type of statistical operation to perform on the dataset
...	additional arguments passed to <code>terra</code> or <code>sf</code> methods See details
as.sf	logical, returns an object of class <code>sf</code>
as.geojson	logical, returns an object of class <code>geojson</code>

Details

operation: supported operations are:

operation	value
max	= 0
min	= 1
median	= 2
sum	= 4
average	= 5 (<i>default value</i>)

dist: numeric, buffer distance for each object coordinate
nQuadSegs: integer, number of segments per buffer quadrant

Value

A data frame of IMERG data:

id	the index for the rows in object
dates	the dates from which imerg was requested
lon	the longitude as provided in object
lat	the latitude as provided in object
imerg	the IMERG value

Examples

```
lonlat <- data.frame(lon = c(-55.0281, -54.9857),
                    lat = c(-2.8094, -2.8756))

dates <- c("2017-12-15", "2017-12-31")

dt <- get_imerg(lonlat, dates)

dt
```

precip_indices *Compute precipitation indices over a time series.*

Description

Compute precipitation indices over a time series.

Usage

```
precip_indices(object, timeseries = FALSE, intervals = NULL)
```

Arguments

object	an object of class chirps as provided by get_chirps
timeseries	logical, FALSE for a single point time series observation or TRUE for a time series based on <i>intervals</i>
intervals	integer no lower than 5, for the days intervals when <i>timeseries</i> = TRUE

Value

A dataframe with precipitation indices:

MLDS	maximum length of consecutive dry day, rain < 1 mm (days)
MLWS	maximum length of consecutive wet days, rain >= 1 mm (days)
R10mm	number of heavy precipitation days 10 >= rain < 20 mm (days)
R20mm	number of very heavy precipitation days rain >= 20 (days)
Rx1day	maximum 1-day precipitation (mm)
Rx5day	maximum 5-day precipitation (mm)
R95p	total precipitation when rain > 95th percentile (mm)
R99p	total precipitation when rain > 99th percentile (mm)
Rtotal	total precipitation (mm) in wet days, rain >= 1 (mm)
SDII	simple daily intensity index, total precipitation divided by the number of wet days (mm/days)

Examples

```
lonlat <- data.frame(lon = c(-55.0281, -54.9857),
                    lat = c(-2.8094, -2.8756))

dates <- c("2017-12-15", "2017-12-31")

dt <- get_chirps(lonlat, dates, server = "ClimateSERV")

# take the indices for the entire period
precip_indices(dt, timeseries = FALSE)

# take the indices for periods of 7 days
precip_indices(dt, timeseries = TRUE, intervals = 7)
```

tapajos

Tapajos National Forest

Description

Geometries for the Tapajos National Forest, a protected area in the Brazilian Amazon

Usage

tapajos

Format

An object of class 'sfc_POLYGON' within the bounding box xmin: -55.41127 ymin: -4.114584
xmax: -54.7973 ymax: -2.751706

Source

The data was provided by the Chico Mendes Institute via <https://www.protectedplanet.net/en>
