The Elementary Particle Entity Notation (PEN) Scheme

Michel Goossens and Eric van Herwijnen
CERN, CH-1211 Geneva 23, Switzerland

July 20, 2001

Abstract

In this article an Elementary Particle Entity Notation (PEN) scheme is proposed for use with TEX and SGML. This scheme not only assures the typographic correctness of the printed symbols, but also eases the automatic extraction of information about the article by the recognition of the entity names.

Keywords: Text-processing; SGML; TEX; Elementary particles; PEN

1 Typographical rules for scientific texts

In scientific texts the printed form of a symbol often implies a meaning which is not easily captured by generic markup. Therefore authors using some form of generic coding (like LATEX or SGML) need to know about typographical conventions. The following is a brief summary of the most important rules for composing scientific texts[1, 2].

1. The most important rule is *consistency*: a symbol should always be the same, whether it appears in a formula or in the text, on the main line or as a superscript or subscript. I.e. in TEX, once you have used a symbol inside mathematics mode ('$'), always use it inside mathematics mode. Inside math mode, TEX by default prints characters in *italics*.

   For scientific work, however, quite a few symbols must be set in *roman* (upright) characters [1]. This is the case for the following families of symbols, which represent the names of:

   - units, such as g, cm, s, keV. Note that physical constants are usually in italics, so units involving constants are mixed roman-italics, e.g. GeV/*c* (where the *c* is italic because it symbolizes the speed of light, a constant);
   - particles, for example p, K, q, H. For elementary particles the PEN (Particle Entity Notation) scheme is proposed (see the next section);
   - standard mathematical functions (sin, det, cos, tan, Re, Im, etc.). Use the built-in LATEX functions for these (`\sin` etc.);
   - chemical elements, for example Ne, O, Cu;
   - numbers;
   - names of waves or states (p-wave) and covariant couplings (A for axial, V for vector), names of monopoles (E for electric, M for magnetic);
   - abbreviations that are initials of bits of words (exp, for experimental; min, for minimum);
   - the 'd' in integrands (e.g. d*p*).

   In all cases, following these rules will help the reader understand at first glance what one is talking about. Some instances in which it is important to use the correct symbol, in the correct type, are shown in the table below:

[1] With LATEX roman type in maths mode can be achieved by the `\mathrm` command.

roman type		*italic type*	
A	ampere (electric unit)	*A*	atomic number (variable)
e	electron (particle name)	*e*	electron charge (constant)
g	gluon (particle name)	*g*	gravitational constant
l	litre (volume unit)	*l*	length (variable)
m	metre (length unit)	*m*	mass (variable)
p	proton (particle name)	*p*	momentum (variable)
q	quark (particle name)	*q*	electric charge (variable)
s	second (time unit)	*s*	c.m. energy squared (variable)
t	tonne (weight unit)	*t*	time (variable)
V	volt (electric unit)	*V*	volume (variable)
Z	Z boson (particle name)	*Z*	atomic charge (variable)

2. Let your word processor do as much work as it can. Do not try to change your system's defaults too much; this will decrease the portability and maintainability of your documents. TEX implements part of the rules mentioned above by default in math mode.

3. Do not add blanks at random to make formulae look "nicer''.

4. Restrain from using specific page layout commands (like `\break` with TEX). You will forget that you put them in your text and later wonder why some text is badly adjusted or starts a new line.

2 Entity definitions for elementary particles

In texts on high energy physics frequently re-occurring strings are the names of elementary particles. For example, the Z^0 particle can be coded in various different ways with LATEX: `$\mbox{Z}^0$`, `$\mathrm{Z^0}$` and `Z$^0$` all achieve the same typographical effect, a roman Z with a superscript 0. In the interest of standardization and typing convenience, we propose below an "entity" naming scheme, which will not only relieve the user from having to worry about the correctness of what he types, but also will allow an automatic extraction of the particle names from the input file, so that it will be easy to enter data about an article using this convention into a database of abstracts.

The naming scheme uses a notation which takes the following constraints into consideration:

1. The notation should be able to describe all particles in the particle data summary tables from the "Review of Particle Properties"[3] and any future extension to these.

2. The names should not exceed eight characters. This is the maximum length for entities in the SGML reference concrete syntax[4]. Staying within this limit means that the notation can be used with most SGML applications.

3. Common particles such as protons and electrons should have short and simple names.

4. Items that are indicated by superscripts are indicated before items that are indicated by subscripts.

Due to the eight character limitation the mass could not be added to the name. This means that in general an entity on its own is not adequate to unambiguously identify a particle, c.f. $\eta(549)$ and $\eta(1300)$ are both referred to as `Pgh`. Including mass dependences into the names is not a good idea anyway, since the mass can change with time when more precise measurements become available. The ambiguity was solved by adding a letter to the end of the name where a mass appears in the name in the particle data summary tables. Thus $\eta(549)$ is referred to as `Pgh` while $\eta(1300)$ is referred to as `Pgha`. Higher letters correspond to higher masses, in the order given in the tables.

The PEN scheme is independent of any text processing system. We have implemented it in TEX (in such a way that it may be used in all macro packages, e.g. LATEX) and SGML. The TEX implementation will print particle masses, which will be regularly updated according to the Review of Particle Properties publication. It is constructed so that the PEN name can be used both in mathematics and text mode.

2.1 Principles of the Particle Entity Notation (PEN)

Starting at the left, a name is built from the following characters:

1. Start the entity with a recognized string (in the following this was chosen as `uppercase P`). This is necessary to uniquely identify entities as following the PEN convention.
2. The following letters act as an escape to signal a special interpretation of the string. Present escape sequences are:
   - `a` for anti particle (normally visually represented with a bar over the particle's name)
   - `b` for bottom particle
   - `c` for charmed particle
   - `g` for indicating the subsequent letter is Greek. The correspondence between Latin and Greek letters is based on the notation for mathematical Greek characters used by the AAP mathematical formula application[5]:

     ```
     <!NOTATION greek2 PUBLIC "+//ISBN 1-880124::NISO//NOTATION GREEK-2//EN">
     ```

     This one-letter correspondence is as follows:

Greek	name	code	Greek	name	code	Greek	name	code	Greek	name	code
α	alpha	a	Α	Alpha	A	β	beta	b	Β	Beta	B
γ	gamma	g	Γ	Gamma	G	δ	delta	d	Δ	Delta	D
ε	epsilon	e	Ε	Epsilon	E	ζ	zeta	z	Ζ	Zeta	Z
η	eta	h	Η	Eta	H	θ	theta	q	Θ	Theta	Q
ι	iota	i	Ι	Iota	I	κ	kappa	k	Κ	Kappa	K
λ	lambda	l	Λ	Lambda	L	μ	mu	m	*Μ*	Mu	M
ν	nu	n	Ν	Nu	N	ξ	xi	x	Ξ	Xi	X
ο	omicron	o	Ο	Omicron	O	π	pi	p	Π	Pi	P
ρ	rho	r	Ρ	Rho	R	σ	sigma	s	Σ	Sigma	S
τ	tau	t	Τ	Tau	T	υ	upsilon	u	ϒ	Upsilon	U
ϕ	phi	f	Φ	Phi	F	χ	chi	c	Χ	Chi	C
ψ	psi	y	Ψ	Psi	Y	ω	omega	w	Ω	Omega	W

   - `q` for quark particle
   - `s` for strange particle
   - `S` for supersymmetric particle
   - `t` for top particle
3. The one-letter name of the particle
4. Optionally followed by other information
   - `z` for zero, `i` for one, `ii` for two, `iii` for three, `iv` for four
   - `m` for minus, `p` for plus, `pm` for plus/minus
   - `pr` for prime
   - `st` for asterisk (star)
   - `L` for left handed, `R` for right handed
   - any one-letter particle name

2.2 Particle encodings according to the PEN Scheme

In table 1 we show how to encode the particles from the summary tables of particle properties in the "Review of Particle Properties"[3] using the PEN convention. In the rightmost column we give the computer name of the particle, as defined by "A guide to Experimental Elementary Particle Physics Literature (1985-1989)"[6]. This is the name to be used when searching the Particle Data group's databases. Notice that these names cannot be used either for TEX or SGML, as they do not satisfy the constraints of the PEN scheme as defined above. When a name is marked as "`not available`", sometimes a charged or neutral version exists (not given in the table).

The TEX implementation is available as a style file `pennames.sty` which should be input in the usual way at the start of the document for TEX or specified as a minor option on the `\documentstyle` command for LATEX. To obtain the symbol required, prefix the PEN name by a backslash ("\").

The SGML implementation exists as a public entity set, that can be included in SGML documents with the following entity definition:

```
<!ENTITY % PEN PUBLIC
   "+//ISBN 92-9083-041-7::CERN//ENTITIES Particle Entity Names//EN">
```

Refer to a particle entity by prefixing its name by an ampersand ("&") and suffixing it with a semi-colon (";").

PgSe	$\Sigma(1775)D_{15}$	Sigma (1775) D 15	not available
PgSf	$\Sigma(1915)F_{15}$	Sigma (1915) F 15	not available
PgSg	$\Sigma(1940)D_{13}$	Sigma (1940) D 13	not available
PgSh	$\Sigma(2030)F_{17}$	Sigma (2030) F 17	not available
PgSi	$\Sigma(2050)$	Sigma (2250)	not available

Table 1: PEN names (*continued*)

PEN	symbol	conventional name	computer name
Ξ Baryons (S=–2, I=1/2)			
PgXz	Ξ^0	Xi zero	XI0
PagXz	$\overline{\Xi}^0$	anti Xi zero	XIBAR0
PgXm	Ξ^-	Xi minus	XI-
PagXp	$\overline{\Xi}^+$	anti Xi plus	XIBAR+
PgXa	$\Xi(1530)P_{13}$	Xi (1530) P 13	not available
PgXb	$\Xi(1690)$	Xi (1690)	not available
PgXc	$\Xi(1820)D_{13}$	Xi (1820) D 13	not available
PgXd	$\Xi(1950)$	Xi (1950)	not available
PgXe	$\Xi(2030)$	Xi (2030)	not available
Ω Baryons (S=–3, I=0)			
PgOm	Ω^-	Omega minus	OMEGA-
PagOp	$\overline{\Omega}^+$	anti Omega plus	OMEGABAR+
PgOma	$\Omega(2250)^-$	Omega (2250) minus	OMEGA(2250)-
Charmed Baryons (C=+1)			
PcgLp	Λ_c^+	charmed Lambda plus	LAMBDA/C+
PcgXz	Ξ_c^0	charmed Xi zero	not available
PcgXp	Ξ_c^+	charmed Xi plus	not available
PcgS	$\Sigma_c(2455)$	charmed Sigma (2455)	not available
Supersymmetric Particles			
PSgg	$\tilde{\gamma}$	photino	PHOTINO
PSgxz	$\tilde{\chi}_i^0$	neutralino	NEUTRALINO
PSZz	$\tilde{Z}^0$	supersymmetric Z zero	ZINO
PSHz	$\tilde{H}_j^0$	Higgsino	HIGGSINO
PSgxpm	$\tilde{\chi}^{\pm_i}$	chargino	CHARGINO
PSWpm	$\tilde{W}^{\pm}$	supersymmetric W +-	not available
PSHpm	$\tilde{H}^{\pm_j}$	charged Higgsino	not available
PSgn	$\tilde{\nu}$	scalar neutrino	not available
PSe	$\tilde{e}$	scalar electron	not available
PSgm	$\tilde{\mu}$	scalar muon	not available
PSgt	$\tilde{\tau}$	scalar tau	not available
PSq	$\tilde{q}$	scalar quark	SQUARK
PaSq	$\overline{\tilde{q}}$	scalar anti quark	SQUARKBAR
PSg	$\tilde{g}$	gluino	GLUINO
